

Team Ruby - Project - Dry Run

*** How to compile and run your code**

first, unzip the appcode.zip file by running “unzip appcode.zip”

next, run “cd appcode” to get into the directory

next, run “./jbin/jruby main.rb <list-file location> <result location>”

This will read the files and process the program. As a bonus, they will be printed out to ./response as well as the list file being written to ./listfile.txt

*** Which CADE machine you tested your program on (this info may be useful to us if we have trouble running your program)**

This was tested on lab1-37.

We have jruby installed under the directory /jbin that is included in the zip.

type in:

./jbin/jruby main.rb <list-file location> <result location>

for example

./jbin/jruby main.rb ./outputList.txt ./results

will produce all the correct {num}.response files under the directory **results**

*** Any known bugs, problems, or limitations of your program**

None right now
